

# SW-F200 SORGHUM SUDAN

SW-F200 is a fast growing, fine leafed hybrid with excellent palatability. This hybrid provides a high quality product that can be used for grazing, hay, cut & carry as well as silage. SW-F200 has a high leaf to stem ratio and has a quick regrowth, making it suitable for multiple cuttings.

Standability	Excellent
Palatability	Excellent
Digestibility	Excellent
Seedling Vigor	Very Good
Intensive Grazing	Very Good
Range grazing	Very Good
Hay production	Very Good
Brix level - sweetness	Low
Silage	Good
Planting - soil temp	15 Degrees Minimum
Plant population - Dryland	120-160,000
Plant population - Irrigation	200,000
Seed size	30,000/kg approx

## Soil Fertility

Sorghum is best suited to fertile soils. Ensure potassium levels are adequate in acidic soils. Do not exceed 110kg/ha of nitrogen. An independent soil test is advised before sowing.

## Forage Management

Avoid grazing or cutting sorghum below 15cm plant height. First grazing or cutting should be conducted at approximately 1 metre to increase plant productivity. Be aware of the risk of prussic acid (HCN) poisoning with forage sorghum's. Risk is greatest when crops are < 60 cm high or are moisture stressed or frosted. Cut or graze when 60–120 cm high to maintain best quality.

## Seeding

Sow seeds shallow into adequately moistened soil. Seeding rate for marginal dryland at 5–10 kg/ha. For favourable dryland or irrigation, 10–20 kgs/ha and use highest rate for irrigation.
